IN THE CLAIMS

1. (Cancelled)

2. (Currently amended) A vise comprising:

(a) A body, said body having:

(i) at least one external face;

(ii) each said at least one face having a respective jaw track formed therein;

(iii) at least one respective internal bore formed in said body adjacent said respective jaw track, said at least one respective internal bore including a sidewall; and

(iv) said at least one respective internal bore including a respective opening extending through said sidewall;

(b) at least [~~respective~~] one respective piston disposed at least partially in a respective one of said at least one internal bore;

(c) at least one respective master jaw slidably disposed at least partially in said respective jaw track; and

(d) a respective member operatively connecting said at least one respective master jaw with said at least one respective piston, said respective member extending through said respective opening.

3. (Previously presented) The vise of claim 2 including a respective top jaw carried by said at least one master jaw.

4. (New) The vise of claim 2, wherein said at least one respective master jaw and said at least one respective piston comprises respective holes alignable with each other, and wherein said respective member comprises a pin disposed in said respective holes.

5. (New) The vise of claim 2, wherein said at least one external face comprises a planar face.

6. (New) The vise of claim 2, wherein said at least one respective jaw track comprises an opening which separates said at least one external face into two portions.

7. (New) The vise of claim 2, wherein said at least one master jaw comprises two oppositely extending legs.

8. (New) The vise of claim 7, wherein said oppositely extending legs depend downwardly away from each other, at an oblique angle relative to said external face.

9. (New) The vise of claim 8, wherein said oppositely extending legs extend away from each other, generally parallel to said external face.

10. (New) A vise comprising:

(a) a body having:

(i) at least one external face;

(ii) each said at least one face having a respective jaw track adjacent thereto; and

(iii) at least one respective internal bore formed in said body adjacent said respective jaw track;

(b) at least one respective piston disposed in a respective one of said at least one internal bore; and

(c) at least one respective master jaw slidably disposed at least partially in said respective jaw track, operatively connected to a respective one of said at least one piston whereby said master jaw and said respective one of said at least one piston move concomitantly, said at least one respective master jaw not being in contact with said at least one external face.

11. (New) The vise of claim 10, wherein said respective jaw track is disposed intermediate said at least one internal bore and said at least one external face.

12. (New) The vise of claim 10, wherein said respective jaw track comprises two oppositely extending legs.

13. (New) The vise of claim 12, wherein said oppositely extending legs depend downwardly away from each other, at an oblique angle relative to said external face.

14. The vise of claim 2, including a respective top jaw carried by said at least one master jaw.

15. The vise of claim 14, comprising a connection between said respective top jaw and said at least one master jaw, said connection being configured to urge said respective top jaw against said at least one face as a result of force urging said top jaw against said master jaw.

16. (New) The vise of claim 15, wherein said connection is a dove tail connection.

17. (New) A vise comprising:

(a) a body having:

(i) at least one external face;

(ii) each said at least one face having a respective jaw track adjacent thereto, said respective jaw track; and

(iii) at least one respective internal bore formed in said body adjacent said respective jaw track;

(b) at least one respective piston disposed in a respective one of said at least one internal bore; and

(c) at least one respective master jaw slidably disposed at least partially in said respective jaw track and operatively connected to a respective one of said at least one piston whereby said master jaw and said respective one of said at least one piston move concomitantly, said master jaw comprising two oppositely extending legs.

18. (New) The vise of claim 17, wherein said oppositely extending legs depend downwardly away from each other, at an oblique angle relative to said external face.

19. (New) The vise of claim 17, wherein said oppositely extending legs extend away from each other, generally parallel to said external face.

20. (New) A vise comprising:

(a) a body having:

(i) at least one external face;

(ii) each said at least one face having a respective jaw track adjacent thereto, said respective jaw track; and

(iii) at least one respective internal bore formed in said body adjacent said respective jaw track;

(b) at least one respective piston disposed in a respective one of said at least one internal bore;

(c) at least one respective master jaw slidably disposed at least partially in said respective jaw track, operatively connected to a respective one of said at least one piston whereby said master jaw and said respective one of said at least one piston move concomitantly;

(d) a respective top jaw operatively connected to said at least one respective master jaw through a connection, said connection configured to urge said respective top jaw against said at least one face as a result of force urging said top jaw against said master jaw.

21. (New) The vise of claim 20, wherein said connection is a dove tail connection.
